XHAW5112 presentation on the Mobile Application, Wireframes, and Website

Introduction

- The group consists of Tshegofatso and Nikhil
- Tshegofatso was selected as the leader for Task 2
- Nikhil was given the task to build and complete the Mobile application
- Tshego was given the task to do the Wireframes and to build and complete the website.
- We chose Scenario 1 from the brief and built the academy around it.
- Tagline: “Caring, Trustworthy & Professional”.

Design choices for the Mobile Application and Website

- The color scheme was chosen with the help of blue colors to create the sense of trust and dependability, navy blue to convey reliability and professionalism, black to present the content clearly, and grey to add balance. All colors are united with the tagline “Caring, Trustworthy & Professional” that conveys the main idea of the website and is supported by all colors. One palette is used for the website and application to ensure coherence.

Why we picked this logo

- Relevant imagery: The dog and cat illustrations represent our focus on pets and their care.
- Paw print: Reinforces the animal theme and makes the logo more recognisable.
- Circular design: Creates a balanced, neat and professional appearance.
- Simple design: Keeps the logo clean, modern and easy to recognise.
- Versatility: The logo can be used across our website and other branding materials

Wireframes

- The wireframes were made using Canva and consist of 19 high fidelity screens: 13 for the website and 9 for the mobile app.
- The app screens are the welcome screen, Our Academy Story, courses, course detail, quote calculator and contact.
- The Website screen same as the app screens with additional screens being for the in-depth information about the courses.

Issues faced for the website

- **Quote calculator without JavaScript.** HTML can’t do maths, so I built a lookup table: count your professional and short courses and read the total
- **Colours and fonts without CSS.** I used older HTML attributes (`bgcolor`, `<font color>`, `<font face>`) to apply our palette and fonts.
